14. About Cybok

1. What is Cybok?

Cybok is a complete, **free** AI workspace that runs on your own computer and opens in your web browser. It looks and feels like a modern AI assistant, with its own identity, design and features:

- **AI Chat** - ask questions, write, translate, summarize, code, debug, solve math and brainstorm. Answers appear word by word.
- **Create Image** - turn a text description into pictures in 12 styles.
- **Logo Studio** - instant vector logos plus AI-designed logo concepts for any brand.
- **File analysis** - upload PDF, Word, Excel, CSV, PowerPoint, text, code or images and ask about them.
- **Library** - every upload, image, logo and saved answer in one searchable place.
- **Chat history** - auto-saved chats with pin, rename, archive, delete, restore, search and share.
- **Voice** - talk to Cybok and hear answers out loud.
- **Admin panel** - users, statistics, AI models, free API keys, announcements and Cybok's official creation date.

> **TIP** Cybok uses only free, openly licensed AI models (Meta Llama, gpt-oss, FLUX). You never pay anything. The model in use is always shown under the message box.

2. What you need

Item	Details
Computer	Windows 10/11 (also works on macOS and Linux). 8 GB RAM or more recommended for the offline model.
Python	Version 3.10 or newer from **python.org/downloads**. During installation tick **"Add Python to PATH"**.
Internet	Needed the first time (to install packages). Afterwards Cybok can run fully offline with Ollama.
Disk space	About 300 MB for Cybok, plus about 2 GB for the free offline AI model (optional).
Browser	Chrome or Edge recommended (needed for voice input). Firefox and Safari work for everything else.

> **TIP** To check Python, open a terminal and type `python --version`. You should see `Python 3.10` or higher.

3. Quick start (5 minutes)

The easiest way - no typing needed:

- **Step 1.** Install Python (see section 2).
- **Step 2.** Open the folder **Project 4 [Cybok] AI Chatbot**.

- **Step 3.** Double-click **start.bat**. The first start installs everything automatically (1-3 minutes).
- **Step 4.** Your browser opens **http://127.0.0.1:5000**. Click **Start Chatting** and create your account.
- **Step 5.** Connect a free AI model (section 5) - then start chatting!

IMPORTANT Keep the black start.bat window open while you use Cybok - it is the Cybok server. Close it (or press Ctrl + C) to stop Cybok.

TIP The **first account** you create automatically becomes the **administrator**.

4. Running Cybok from the command line

If you prefer typing commands, or you are on macOS/Linux, follow these steps exactly.

Windows (PowerShell or Command Prompt)

1) Open the project folder in a terminal. In File Explorer, open the Cybok folder, click the address bar, type **powershell** and press Enter. Or:

```
cd "C:\Users\<YourName>\OneDrive\Desktop\Project 4 [Cybok] AI Chatbot"
```

2) Create a private Python environment (first time only):

```
python -m venv .venv
```

3) Install Cybok's packages (first time only, and after updates):

```
.venv\Scripts\python.exe -m pip install -r requirements.txt
```

4) Start Cybok:

```
.venv\Scripts\python.exe run.py
```

5) Open **http://127.0.0.1:5000** in your browser (it usually opens by itself).

> **TIP** Shortcut: in Command Prompt you can simply run `start.bat` - it does steps 2-4 for you every time.

macOS / Linux (Terminal)

```
cd ~/path/to/"Project 4 [Cybok] AI Chatbot"
bash start.sh

# or manually:
python3 -m venv .venv
.venv/bin/python -m pip install -r requirements.txt
.venv/bin/python run.py
```

Useful start options

Command	What it does
`python run.py`	Start Cybok on http://127.0.0.1:5000
`python run.py --port 8080`	Use a different port if 5000 is busy
`python run.py --host 0.0.0.0`	Let phones/tablets on your Wi-Fi open Cybok
`python run.py --no-browser`	Don't open the browser automatically
`python run.py --dev`	Developer mode with auto-reload

On Windows, write `.venv\Scripts\python.exe` instead of `python` in these commands (or activate the environment first with `.venv\Scripts\activate`).

5. Connect a free AI model

Cybok is free, but it needs at least one AI engine. Choose **one or both** options - both cost nothing. If one engine is busy, Cybok automatically answers with the next available one.

	Option A: Ollama (offline)	Option B: Groq (cloud)
Cost	Free forever	Free tier, no credit card
Account	None	Free Groq account
Internet	Not needed after download	Needed
Speed	Depends on your PC (CPU)	Very fast
Models in Cybok	Cybok Local	Cybok Fast, Cybok Smart, GPT-OSS 120B, Llama 4 Vision

Option A - Ollama: AI on your own computer

- Download and install Ollama from **https://ollama.com/download** (or run the command below).
- Download the free model once (about 2 GB):

```
winget install Ollama.Ollama      # Windows - or use the installer from ollama.com
ollama pull llama3.2
```

Ollama runs in the background (look for the llama icon near the clock). Refresh Cybok and pick **Cybok Local** in the model menu.

Option B - free Groq key

- Open **https://console.groq.com/keys** and sign up (Google sign-in works).
- Click **Create API Key** and copy the key (it starts with `gsk_`).
- In Cybok open **your profile menu > Admin panel > System & APIs > Free AI keys**, paste the key next to Groq and click **Save**.
- Refresh the page - Cybok Fast, Cybok Smart, GPT-OSS 120B and Llama 4 Vision are now unlocked.

Prefer the command line? This asks for the key and saves it into the **.env** file:

```
.venv\Scripts\python.exe run.py setup
```

To test every model at once:

```
.venv\Scripts\python.exe run.py check
```

> **IMPORTANT** Keep keys secret. Cybok stores them only on the server and never sends them to the browser.

Other free options: an **OpenRouter** key (openrouter.ai/keys) unlocks the OpenRouter free model; a **Hugging Face** token lets you switch the image generator to FLUX.1-schnell on Hugging Face. Images work without any key by default.

6. Your first sign-in

- Open Cybok and click **Start Chatting**, then **Create an account** (name, e-mail, password with a letter and a number).
- The first account becomes the **admin**. Later accounts are normal users.
- **Forgot your password?** Click *Forgot password?* on the sign-in page. If e-mail isn't configured, the reset link is printed in the black server window - copy it into your browser.
- Admins can also reset a password from the command line: `python run.py reset-password you@example.com`

7. Using Cybok

Chatting

- Type in the message box and press **Enter** to send (**Shift + Enter** for a new line).
- Answers stream in live. Press the **stop** button (or **Esc**) to stop early.
- Under each answer: **Copy**, **Read aloud**, **Regenerate**, **Like/Dislike**, **Save to Library** and **Share**.
- Hover your own message and click the pencil to **edit** it - Cybok answers again from that point.
- Code appears in highlighted blocks with a **Copy** button. Tables, lists, headings and math formulas are formatted automatically.
- Reasoning models show a collapsible **Reasoning** section with their thinking.

Choosing a model

Click the model name at the top of the chat. Every model shows its real name and provider. Greyed-out models tell you exactly what free step unlocks them. Set your favourite in **Settings > Chat > Default model**.

Files and documents

- Click the **paperclip**, drag files onto the message box, or paste a screenshot (Ctrl + V).
- Supported: PDF, DOCX, PPTX, ODT, TXT, MD, CSV, TSV, XLSX, JSON, HTML, code files and images (PNG, JPG, WebP, GIF, BMP). Default limit: 20 MB.
- Then ask: *"Summarize this PDF"*, *"Find the important numbers in this Excel file"*, *"Explain this document"*.
- Spreadsheets get automatic statistics (sum, average, min, max) so number questions are accurate.
- To ask about pictures, choose a model marked **Vision** (Llama 4 Scout Vision).

Create Image

- Open **Create Image** in the sidebar, describe your picture, pick a style, size and number of images, then click **Generate**.
- Hover a result to **save to Library**, **download**, **regenerate**, reuse the prompt or **delete**. Click to view full size.
- Inside a chat, click the **image** button next to the paperclip to create an image right in the conversation.

Logo Studio

Enter brand name, industry, style, colors (names or #hex codes), symbol and typography. You instantly get 6 vector (SVG) concepts plus optional AI-designed concepts. Save favourites to your Library and download them.

Library

All your uploads, saved images, logos and saved answers. Search, filter by type, sort, switch grid/list view, preview, rename, move into folders, download, delete, or click **Ask Cybok about this** to start a chat with a file.

History, pinning, archive and trash

- Chats save automatically and are grouped by date in the sidebar.
- Click **...** on a chat to **Rename** (or double-click / F2), **Pin**, **Share**, **Export**, **Archive** or **Delete**.
- Pinned chats stay at the top. Deleted chats go to **Archived & Trash** for 30 days and can be restored.
- Turn off **Settings > Privacy > Save chat history** for temporary chats that are removed when you sign out.

Search

Press **Ctrl + K** (or click Search) to search chat titles and message text, files (including text inside documents), images, logos and saved answers, and to run quick commands.

Sharing

Click the **share** icon, then **Create link**. Anyone with the link sees a read-only copy - never your name, e-mail or other chats. Disable or replace the link at any time (Settings > Privacy > Shared links).

Voice

- **Microphone** button: dictate your message (speech to text).
- **Speaker** button under an answer: read it aloud. Turn on auto-read in **Settings > Voice** and choose a voice and speed.
- **Headphones** button: hands-free voice conversation - speak, Cybok answers out loud, then listens again.
- The browser asks for microphone permission the first time. Voice input works in Chrome and Edge.

Settings

Open from your profile menu (bottom-left) or press **Ctrl + ,**. Sections: **Account** (name, e-mail, photo, password, sign out everywhere, delete account), **Appearance** (light/dark/system, accent color, text size), **Chat** (default model, response style, Enter-to-send, custom instructions), **Voice**, **Privacy & Data** (history, export, shared links, delete all chats), **Notifications**, **Shortcuts** and **About**.

8. Keyboard shortcuts

Action	Keys
Search everything	Ctrl + K
New chat	Ctrl + Shift + O
Show / hide sidebar	Ctrl + B
Image mode in chat	Ctrl + Shift + I
Focus the message box	Shift + Esc
Stop generating	Esc
Copy last answer	Ctrl + Shift + C
New line	Shift + Enter
Rename selected chat	F2
Settings	Ctrl + ,
Show all shortcuts	Ctrl + /

9. Admin panel

Admins see **Admin panel** in the profile menu (or open **http://127.0.0.1:5000/admin**). Normal users cannot open it.

Tab	What you can do
Overview	Total and active users, conversations, AI requests, image generations, uploads, storage, 14-day activity chart, model usage.
Users	Search users, enable/disable accounts, make someone admin, delete users.
AI Models	Add, edit, enable/disable or delete models, change order, test a model. Any OpenAI-compatible API works.
System & APIs	Paste **free AI keys**, set Cybok's **official creation date**, open/close sign-ups, max upload size, default model, extra system prompt, image provider.
Announcements	Show a banner message to all users (info, success or warning).
System errors	See provider failures and server errors; clear the log.

Cybok's official creation date

When someone asks *"When were you manufactured?"*, Cybok answers with the date set in **Admin > System & APIs > Cybok identity**. If no date is set, Cybok honestly says: *"My official creation date has not been configured yet."* It never invents a date. From the command line:

```
.venv\Scripts\python.exe run.py set-creation-date 2026-10-08
.venv\Scripts\python.exe run.py set-creation-date ""      # clear it
```

Adding another free model

Admin > AI Models > **Add model**. Fill in: display name, slug, provider label, model family, API base URL (e.g. `https://api.groq.com/openai/v1` or `http://localhost:11434/v1`), the provider's model id, and the key's environment variable name. Click **Test** to verify. No code changes or restart needed.

10. Command reference

Run these inside the Cybok folder. On Windows use `.venv\Scripts\python.exe` in place of `python`.

Command	Purpose
`start.bat`	One-click install + start (Windows)
`bash start.sh`	One-click install + start (macOS / Linux)
`python run.py`	Start the Cybok server
`python run.py setup`	Save a free Groq key and check Ollama
`python run.py check`	Test which AI models answer
`python run.py make-admin EMAIL`	Give an account the admin role
`python run.py reset-password EMAIL`	Set a new password for an account
`python run.py set-creation-date YYYY-MM-DD`	Set Cybok's official creation date
`ollama pull llama3.2`	Download the free offline model
`python docs/build_manual.py`	Rebuild this PDF manual

11. Optional extras

All settings live in the **.env** file in the Cybok folder (open it with Notepad). Restart Cybok after editing it.

Use Cybok on your phone (same Wi-Fi)

```
.venv\Scripts\python.exe run.py --host 0.0.0.0
```

Find your PC's IP address with `ipconfig` (e.g. 192.168.1.20) and open **http://192.168.1.20:5000** on your phone. Allow Python through Windows Firewall when asked. Add it to your home screen to use it like an app.

Continue with Google

- Go to **console.cloud.google.com/apis/credentials**, create an **OAuth client ID** of type **Web application**.
- Add the redirect URI `http://127.0.0.1:5000/auth/google/callback` (and your real domain later).
- Put the values in .env: `GOOGLE_CLIENT_ID=...` and `GOOGLE_CLIENT_SECRET=...`, then restart.

Password-reset e-mails

Fill `MAIL_SERVER`, `MAIL_PORT`, `MAIL_USERNAME`, `MAIL_PASSWORD` in .env. For Gmail use smtp.gmail.com, port 587 and an **App Password**.

Putting Cybok online

- Use a server or a host that runs Python (for example a VPS, Render or Railway). Run `python run.py --host 0.0.0.0 --no-browser`.
- Put HTTPS in front (Nginx, Caddy or Cloudflare) and set `PUBLIC_URL=https://your-domain`, `SESSION_COOKIE_SECURE=true` and `BEHIND_PROXY=true`.
- Online, use Groq for AI (Ollama only works where it is installed). For many users, PostgreSQL can be used via `DATABASE_URL`.

12. Troubleshooting

Problem	Solution
'python' is not recognized	Reinstall Python and tick **Add Python to PATH**, or use `py` instead of `python`.
Port 5000 already in use	Start with `run.py --port 8080` and open http://127.0.0.1:8080
"Connect a free AI model" banner	No AI engine is connected yet. Follow section 5 (Ollama or a free Groq key).
Cybok Local is greyed out	Install Ollama, run `ollama pull llama3.2`, make sure Ollama is running, then refresh.
Groq models are greyed out	Paste your key in Admin > System & APIs > Free AI keys, or run `run.py setup`.
"rate limit reached"	Free tiers limit requests per minute. Wait a moment or pick another model.
Slow answers with Cybok Local	Normal on older CPUs. Close heavy apps, or use Groq for speed.
Image generation fails	The free image service may be busy - retry in a few seconds. Check your internet connection.
No text found in a PDF	Scanned PDFs are pictures. Use a text PDF, or take a screenshot and ask a Vision model.
Microphone doesn't work	Use Chrome or Edge and allow microphone access (padlock icon in the address bar).
Forgot admin password	`run.py reset-password your@email.com`
Page looks broken / old	Press Ctrl + F5 to reload without cache.

13. Your data, backups and updates

- All data is stored in the **instance** folder: `instance\cybok.db` (database) and `instance\storage` (files and images).
- **Backup:** stop Cybok and copy the whole **instance** folder and your **.env** file somewhere safe.
- **Restore:** put them back in the Cybok folder and start Cybok.
- **Each user** can export their own data in Settings > Privacy & Data > Export.
- **Updating:** replace the program files but keep **instance** and **.env**, then run start.bat (it installs any new packages).

> **IMPORTANT** Never share your .env file or the instance folder - they contain secret keys and private conversations.

14. About Cybok

Cybok - Your AI. Your Workspace.

Created by **Saif Mughal**, University Student, Faisalabad, Pakistan.

Ask Cybok *"Who made you?"* and it answers: *"I was created by Saif Mughal, a university student from Faisalabad, Pakistan."*

Cybok is an independent platform. It is not ChatGPT and is not affiliated with OpenAI or any model provider. AI models are third-party open models, identified by name and provider inside the app.

Manufactured by Saif Mughal
